

What kind of data can I share in LunaDNA?

LunaDNA currently accepts DNA files from 23andMe, AncestryDNA, MyHeritage and FamilyTree DNA, as well as LunaDNA-generated health surveys. We also accept electronic health records (EHRs) via patient portal integrations.

Soon, we will accept additional data types such as whole genome and exome DNA files, RNA, microbiome, fitness/activity trackers, smart devices, medical devices, and many more.

The more comprehensive data collected from each member, the more valuable the data is for driving medical breakthroughs.
